64Mb SerialRAM

1.8V/3.0V, 104MHz, SPI & QPI Protocol

ADVANCED INFORMATION

FEATURES

• Industry Standard Serial Interface

- SPI Protocol: 1-1-1 & 1-4-4 operation
- QPI protocol: 4-4-4 operation
- Low Signal Counts :6 Signal pins (CE#, CLK, SIO0~SIO3)

• High Performance

- Clock Rate:
33MHz(max) for normal read
104MHz(max) for fast read
- Page Size: 1024 Byte
- Configurable Wrapped Burst Length:
32 and 1024 (Default=1024)
- Always Wrapped Burst Operation within page.
- Drive Strength: 50 ohm

• Low Power Consumption

- Single 1.65V to 1.95V Voltage Supply
- Single 2.7V to 3.6V Voltage Supply
- Typical Standby Current:
120 μ A for 1.8V, 150uA for 3.0V

• Hardware Features

- **CLK Input:** Serial clock input
- **SIO0 – SIO3:**
Serial Data Input or Serial Data Output

• Temperature Grades

- Industrial: -40°C to +85°C
- Auto (A1) Grade: -40°C to +85°C
- Auto (A2) Grade: -40°C to +105°C

GENERAL DESCRIPTION

The IS66/67WVS8M8FALL/BLL are integrated memory device containing 64Mb Pseudo Static Random Access Memory using a self-refresh DRAM array organized as 8M words by 8 bits.

The device supports SPI (Serial Peripheral Interface) & QPI (Quad Peripheral Interface) protocols, Very Low Signal Count (6 signal pins; CLK, CE#, and 4 SIOs), Hidden Refresh Operation, and Industrial temperature and Automotive A2 grade temperature.

In-Band Reset is supported instead of dedicated RESET# pin, and minimum transferred data size is 8bit.

PERFORMANCE SUMMARY

Read / Write Operation	
Maximum Clock Rate	104MHz
Maximum Clock to Access Time at 104MHz	7ns

3. Power-up Initialization

The SPI/QPI includes on-chip voltage sensor used to start the self-initialization process. When VDD reaches a stable level at above the minimum VDD, the device will need 150us to complete its self-initialization process.

After the 150us period, the device will be ready for normal operation.

Figure 3.1 POWER-UP Timing

4. Interface Description

4.1 ADDRESS SPACE

Serial PSRAM device is byte-addressable. 64Mb device is addressed with A22 to A0.

4.2 PAGE LENGTH

Read and Write operations are always in wrap mode within 1024 byte.

4.3 DRIVER STRENGTH

Driver strength is 50 ohm measured at ½ VDD.

4.4 POWER-ON STATUS

The device powers up in SPI mode.

At least one clock pulse of CE# HIGH is needed before beginning any operations.

4.5 COMMAND/ADDRESS LATCHING TRUTH

The device recognizes the following commands specified by the various input methods.

Table 4.1 Commands recognized by the device

Command	SPI Mode						QPI Mode				
	Code	CMD	Add	Wait Cycle	DIO	Max Freq.	CMD	Add	Wait Cycle	DIO	Max Freq.
Read	03h	S	S	0	S	33	Q	Q	4	Q	84
Fast Read	0Bh	S	S	8	S	104	Q	Q	4	Q	84
Quad IO Read	EBh	S	Q	6	Q	104	Q	Q	6	Q	104
Write	02h	S	S	0	S	104	Q	Q	0	Q	104
Quad IO Write	38h	S	Q	0	Q	104	Q	Q	0	Q	104
Enter QPI mode	35h	S	-	-	-	-	NA				
Exit QPI mode	F5h	NA					Q	-	-	-	104
RESET Enable	66h	S	-	-	-	104	Q	-	-	-	104
RESET	99h	S	-	-	-	104	Q	-	-	-	104
Set Burst Length	C0h	S	-	-	-	104	Q	-	-	-	104
Read ID	9Fh	S	S	0	S	104	Q	-	6	Q	104
DPD mode Entry	B9h	S	-	-	-	104	Q	-	-	-	104

Note:

1. 03h command in QPI mode is the same with and 0Bh command in QPI Mode.

4.6 READ/WRITE TERMINATION

All reads and writes must be followed immediately by a clock pulse of CE# HIGH in order to terminate the read and writes, and set the device into standby status.

CE# must transition to HIGH after the tHD (Clock rising edge to CE# HIGH).

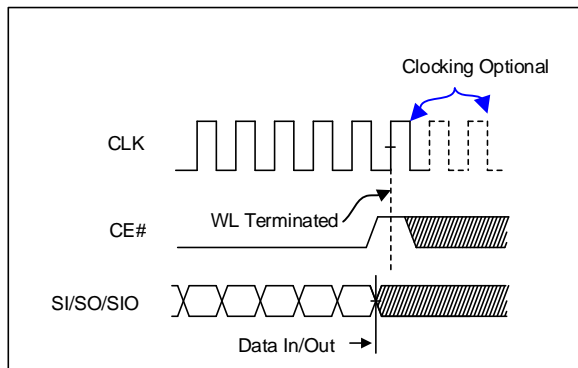

Figure 4.1 Command Termination (Standard Device)

As for optional device, one more clock is required to terminate operation with CE# not active setup time and hold time.

Call factory for optional device.

Figure 4.2 Command Termination (Optional Device)

5. READ/WRITE OPERATIONS

5.1 SPI READ OPERATIONS

For all reads, data will be available for t_{ACLK} after the falling edge of clock. SPI reads can be done in three ways:

- 03h: Serial CMD, Serial IO, slow frequency (1-1-1, 0 Wait Cycle)
- 0Bh: Serial CMD, Serial IO, fast frequency (1-1-1, 8 Wait Cycles)
- EBh: Serial CMD, Quad IO, fast frequency (1-4-4, 6 Wait Cycles)

Figure 5.1 SPI Read, 03h (1-1-1, Max frequency: 33MHz)

Note:

1. Data out goes to High-Z after CE# transitions to HIGH (t_{HZ}).

5.2 SPI WRITE OPERATIONS

02h: Serial CMD, Serial IO, slow frequency (1-1-1, 0 Wait Cycle)

38h: Serial CMD, Quad IO, fast frequency (1-4-4, 0 Wait Cycles)

Figure 5.4 SPI Write Command 02h (1-1-1)

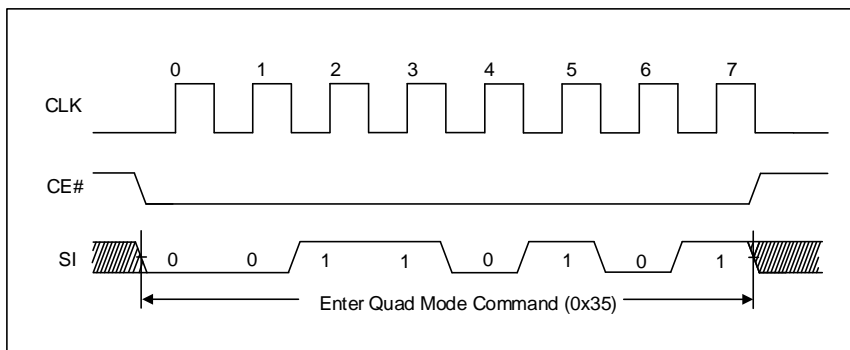

Figure 5.5 SPI Quad IO Write command 38h (1-4-4)

5.3 QPI MODE

35h command switches the device into QPI mode.

Figure 5.6 QPI Mode Enable, 0x35

5.4 QPI FAST READ OPERATION

For all reads in QPI mode, data will be available for t_{ACLK} after the falling edge of clock. QPI reads can be done in two ways:

- 03h: Quad CMD, Quad IO, fast frequency (up to 84MHz, 4 Wait Cycles)
- 0Bh: Quad CMD, Quad IO, fast frequency (up to 84MHz, 4 Wait Cycles)
- EBh: Quad CMD, Quad IO, fast frequency (up to 104MHz, 6-Wait Cycles)

Note:

1. Data out goes to High-Z after CE# transitions to HIGH (tHZ).

Figure 5.8 QPI Fast Read, EBh (Max Frequency: 104MHz)

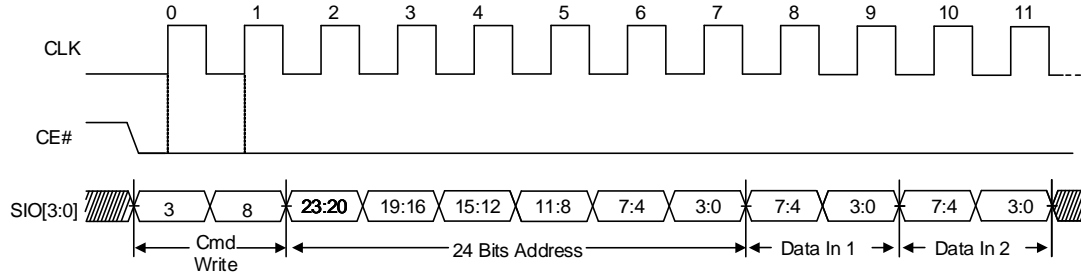

Note:

1. Data out goes to High-Z after CE# transitions to HIGH (tHZ).

5.5 QPI WRITE OPERATION

In QPI mode, either 02h or 38h command can be used for QPI write operation. It has nothing to do with maximum frequency.

Figure 5.9 QPI Write 02h or 38h

5.6 QPI EXIT OPERATION

This command will switch the device back into SPI mode.

Figure 5.10 QPI Mode Exit, F5h (Only available in QPI mode)

5.7 READ ID OPERATION

In SPI mode, this command is similar to Fast Read. But 24-bit address cycles are “don’t care” and there are no wait cycles between address and data.

In QPI mode, there is no address cycles, but there are 6 wait cycles between command and data.

The data is wrapped to bit 7 of MF ID data again after bit 0 of EID data until CE# goes to HIGH.

5.8 RESET OPERATION

Software RESET

The software reset operation is used as a system reset that puts the device in SPI standby mode, which is also the default mode after power up. This operation consists of two commands: RESET Enable (0x66h) and RESET (RST, 0x99).

The reset operations requires the RESET ENABLE command to be followed by the RESET command. Any other command other than the RESET command after the RESET ENABLE command will disable the RESET ENABLE procedure.

Figure 5.9 SPI RESET

Figure 5.10 QPI RESET

5.9 SET BURST LENGTH OPERATION

The Set Burst Operation toggles the device's burst length wrap between 1024 byte and 32 byte. Default burst length is 1024 byte.

Figure 5.11 SPI Set Burst Length, C0h

Figure 5.11 QPI Set Burst Length C0h

5.10 IN-BAND RESET OPERATION

The device offers an additional feature of In-Band RESET function, which uses existing SPI signals to initiate a hardware reset, which is different from existing software reset/hardware reset (dedicated RESET# pin);

- Existing software reset commands often depend on the device being in a particular mode before they are effective. This makes software based reset sequences depend on slave device and mode.
- Dedicated RESET# pin requires additional pin over traditional 8-pins of SPI device. Also it requires 1 more signal for reset operation.

In Band-RESET operation requires 2-signal pins; CE# and SIO0.

- CE# is driven active low to select the SPI slave (note1)
- Clock (CLK) remains stable in either a high or low state(note 2)
- SIO0 is driven low by the bus master, simultaneously with CE# going active low.....(note 3)
- CE# is driven inactive ... (note 4)
- Repeat the above 4 steps, each time alternating the state of SIO0.
- After the fourth CE# pulse, the slave triggers its internal reset.....(note 5)

Note 1 This powers up the SPI slave

Note 2 This prevents any confusion with a command, as no command bits are transferred (clocked)

Note 3 No SPI bus slave drives SIO0 during CE# low before a transition of clock. Slave streaming output active is not allowed until after the first edge of clock.

Note 4 The slave captures the state of SIO0 on the rising edge of CE#

Note 5 SIO0 is low on the first CE#, high on the second, low on the third, high on the fourth ... (This provides a 5th, unlike random noise)

NOTE:

This reset sequence is not intended to be used at normal power on, but to be used only when the device is not responding to the system. This reset sequence will be operational from any state that the device may be in. During the reset process, the device will ignore any chip select (command). In Band-Reset function is supported by optional device (option R) only.

5.11 DEEP POWER DOWN MODE

The Deep Power-down instruction (B9h) is for setting the device on the minimizing the power consumption (enter into Power-down mode). During this mode, standby current is reduced from I_{sb1} to I_{sb2} after t_{DPDIN} .

6. REGISTER

The device has an 64 bit ID Register.

6.1 DEVICE IDENTIFICATION REGISTER

It is a read only, word register that provides device information. The device information fields can be identified as below.

- a. Manufacturer
- b. KGD Test
 - i. Not Passed Yet (55h)
 - ii. Passed (5Dh)
- c. Density

Table 6.2 ID Register

Notes:

1. Applied conditions greater than those listed in “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
